During peak seasons, external haulage contractors are often used by logistic companies. In those cases, it can get complicated to track and integrate those shipments. As of now, there are three options: Either the driver receives a company owned device, the shipment is tracked by paper, resulting in great diligence or it isn't tracked at all.

For those cases, dff solutions provides a process-integrated solution: ArriView LIGHT. ArriView LIGHT is a platform-independent application for smartphones. It realises the tracking of goods without a big investment. No set-up or infrastructural efforts are required, as the system is a cloud-based solution.

The contractor simply has to download the app, type in his name and licence plate number.

Then, he is required to scan the QR-Code for his tasks, which is given to him by the employer.

All required data is loaded to the app. The driver receives an overview of all customers and all the necessary functions are available: An integrated navigation system, the option to place notification calls to the customer or to the warehouse and to type in delays. After a stop is finished, the driver receives an electronical signature confirming the shipment and the option to send a delivery notification to the customer's email address.

The application tracks the shipment via GPS, which enables a whole track-and-trace system. All relevant data is uploaded to be viewed in the BackOffice. After all shipments are delivered, and all data is transferred, the driver simply has to switch off the app. Afterwards the whole overview can be downloaded.
